

Paranormal Investigation at the IMax Esquire Theater in Sacramento

On Saturday, November 29, 2008 my friend Rob Hays and I were privileged to join Paul Dale Roberts and Shannon McCabe and their Haunted and Paranormal Investigations (HPI) investigators at the IMax Esquire Theater in Sacramento. We all arrived at the IMax at 1211 K Street in Sacramento at about 10:15 pm. We were greeted outside by the manager, who gave us a brief history lesson about the theater. There are reportedly at least three spirits haunting the theater. One is a young girl, named Grace, who has been seen in several areas of the building. Another spirit that has been detected by Celebrity Psychic, Nancy Bradley, is of a young boy riding his large-wheeled, old fashioned bicycle around inside the building, and another is of the musician who was robbed and shot to death on the street outside of the theater in the mid 1990s.

The theater manager took us to four or five different areas of the theater and explained some of the things that have occurred in each area. Her office area was the place that I felt the most spirit energy. Adjacent to that office is a storage room, which also opens up into the area where the neon lighting spells out "Esquire" on the outside of the building. I could feel that the spirits of the little girl and boy played in that area by zipping up and down that "neon tunnel" location, at lightening speed, giggling as they did so.

Inside view of "neon tunnel" area.

I also felt a spirit energy on the landing of the top stair well. I believe it to be that of the little girl, who was not visible.

One of my photographs taken when we were in the first hallway near the bathroom where little Grace has been observed on

nervous occasions, captured two orbs—one of which was moving.

I also got high Electromagnetic energy readings in the corner of this same stairwell in the area that is on the other side of the wall to the storage room near by the neon tunnel. The strange thing about this reading is the energy was most intense at about the 3ft level and dropped off considerably the higher up the corner I pointed my meter. This indicates that the meter was not picking up normal electrical current from the other side of the wall.

Many thanks to HPI for allowing us to tag along on this investigation.
